Med. Mycol. 37.357-366(1999).

-!- CATALYTIC ACTIVITY: Hydrolysis of terminal 1,4-linked alpha-D-glucose residues successively from non-reducing ends of the chains with release of beta-D-glucose.

-!- SUBCELLULAR LOCATION: CELL WALL ASSOCIATED.

-!- SIMILARITY: BELONGS TO FAMILY 31 OF GLYCOSYL HYDROLASES.

aureus.";
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                -:- FUNCTION: Riborlavin synthase is a bifunctional enzyme complex catalyzing the formation of riborlavin from 5-amino-6-(1'-0)-ribity1-amino-2,4(1H,3H)-pyrimidinedione and L-3,4-dibytochy-2-butanone-4-phosphate via 6,7-dimethy1-8-lumazine. The beta subunit catalyzes the condensation of 5-amino-6-(1'-D)-ribity1-amino-2,4(1H,3H)-pyrimidinedione with L-3,4-dibydxchy-2-butanone-4-phosphate yielding 6,7-dimethy1-8-(1-D)-ribity1-amino-1-1-CATALYTIC ACTIVITY: 2,6,7-dimethy1-8-(1-D-ribity1)lumazine in inoflavin +4-(1-D-ribity1amino)-5-amino-2,6-dibydroxypyrimidine.-1-PATHWAY: Riborlavin biosynthesis; last step.
-:- SIMILARITY: Belongs to the DWRL synthase family.
-:- CAUTION: Ref. 1 strain Mu50 sequence differs from that shown due to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

Sensory rhodopsin II transducer (HTR-II) (Methyl-accepting phototaxis
                                                                                                                                                                                                                                                                                                                                                                                                                                                  "The primary structure of sensory rhodopsin II: a member of an additional retinal protein subgroup is coexpressed with its transducer, the halobacterial transducer of rhodopsin II."; broc. Natl. Acad. Sci. U.S.A. 92:3036-3040(1995).
-!- FUNCTION: TRANSDUCES SIGNALS FROM THE PHOTOTAXIS RECEPTOR SENSORY RHODOPSIN II (SR-II) TO THE FLAGELLAR MOTOR. RESPONDS TO LIGHT CHANGES THROUGH THE VARIATION OF THE LEVEL OF METHYLATION.
-!- SIMILARITY: Contains 1 methyl-accepting transducer domain.

In virol. 63:3345-332(1989).

J. Virol. 63:3345-332(1989).

- !- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.

NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.

C. !- CATALYTIC ACTIVITY: HYDROPHOSIS of four peptide bonds in the viral precursor polyprotein, commonly with Asp or Glu in the P6 position, Cys or Thr in P1 and Ser or Ala in P1'.

C. !- CATALYTIC ACTIVITY: N nucleoside triphosphate = N diphosphate + (RNA) (N).

C. !- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE. THE ENVELOPE CONSISTS OF TWO PROTEINS:

PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN CAND MRNA.

-!- TISSUE SPECIFICITY: BROWN ADIPOSE TISSUE.
-!- DOWAIN: COMPOSED OF THREE HOMOLOGOUS DOMAINS.
-!- SIMILARITY: Belongs to the mitochondrial carrier family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Kozak U.C., Kopecky J., Teisinger J., Enerback S., Boyer B.,

                                                                                                                                                                                                                                                                                                                                                                                                                                           "FUNCTION: Bifunctional enzyme that catalyzes the formation of 4-
diphosphocytidy1-2C-methy1-D-erythritol from CTP and 2C-methy1-D-
erythritol 4-phosphate (ispp), and converts 4-diphosphocytidy1-2C-
methy1-D-erythritol 2-phosphate into 2C-methy1-D-erythritol 2.4-
cyclodiphosphate and CMP (ispF). Also converts 4-diphosphocytidy1-
2C-methy1-D-erythritol into 2C-methy1-D-erythritol 3.4-
cyclophosphate and CMP (ispF) (By similarity).
-: CATALYTIC ACTIVITY: CTP + 2-C-methy1-D-erythritol 4-phosphate =
diphosphate + 4-(cytidine 5-diphospho)-2-C-methy1-D-erythritol.
-: CATALYTIC ACTIVITY: 2-phospho-4-(cytidine 5-diphospho)-2-C-
methy1-D-erythritol = 2-C-methy1-D-erythritol 2,4-cyclodiphosphate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Multifunctional enzyme; Complete proteome.
DOMAIN 1 244 4-DIPHOSPHOCYTIDYL-2C-METHYL-D-ERYTHRITOL
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            -1- PATHWAY: Nonmevalonate terpenoid biosynthesis pathway; third step.
-1- PATHWAY: Nonmevalonate terpenoid biosynthesis pathway; fifth step.
-1- SIMILARITY: IN THE N-TERMINAL SECTION; BELONGS TO THE ISPD FAMILY.
-1- SIMILARITY: IN THE C-TERMINAL SECTION; BELONGS TO THE ISPP FAMILY.

-!- FUNCTION: Bifunctional enzyme that catalyzes the formation of 4-diphosphocytidy1-2C-methy1-D-erythrito1 from CTP and 2C-methy1-D-erythrito1 4-phosphate (18pD), and converts 4-diphosphocytidy1-2C-methy1-D-erythrito1 2-phosphate into 2C-methy1-D-erythrito1 2,4-cyclodiphosphate and CMP (18pP). Also converts 4-diphosphocytidy1-2C-methy1-D-erythrito1 3,4-cyclodiphosphate and CMP (18pP). Also converts 4-diphosphocytidy1-2C-methy1-D-erythrito1 3,4-cyclophosphate and CMP (18pP) (By similarity).

-!- CATALYTIC ACTIVITY: CTP + 2-C-methy1-D-erythrito1 4-phosphate = diphosphate + 4-(cytidine 5'-diphospho-2-C-methy1-D-erythrito1.

-!- CATALYTIC ACTIVITY: 2-phospho-4 (cytidine 5'-diphospho)-2-C-methy1-D-erythrito1 2,4-cyclodiphosphate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Transferase; Nucleotidyltransferase; Lyase; Isoprene biosynthesis;

"Mak21p of Saccharomyces cerevisiae, a homolog of human CAATT-binding protein, is essential for 60 S ribosomal subunit biogenesis.";

J. Biol. Chem. 273:289212-28920(1998).

- FUNCTION: REQUIRED FOR 60S RIBOSOWAL SUBUNIT SYNTHESIS.

- SUBCELLULAR LOCATION: Nuclear; nucleolar (Probable).

- SIMILARITY: BELONGS TO THE CBF / MAK21 FAMILY.

C. - FUNCTION: Induces apoptotic chromatin condensation after
activation by CASP3 (By similarity).
C. - SUBEELLULAR LOCATION: Nuclear (By similarity).
C. - ALTERNATIVE RODUCTES. This SWISS-PROT entry is copyright. It is produced through a collaboration between the Swiss Institute of Bioinformatics and the EMBL outstation - the Buropean Bioinformatics Institute. There are no restrictions on its use by non-profit institutions as long as its content is no way modified and this statement is not removed. Usage by and for commercial entities requires a license agreement (See http://www.isb-sib.ch/announce/or send an email to license@isb-sib.ch) Isold=Q9JIX8-4; Sequence=VSP_004032;
-!- PTM: Undergoes proteolytic cleavage; the processed form is active, contrary to the uncleaved form (By similarity).
-!- SIMILARITY: Contains 1 SAP downin.
-!- CAUTION: Ref.2 sequence differs from that shown due to frameshifts /FTId=VSP 004031. EASAESEDEMTHPEGVASLLPPDFOSSLNRPELELSTHSPR CLEAVAGE (BY CASPASE-3) (BY SIMILARITY) Missing (in isoform 2). -> G (in isoform 4).
/FTId=VSP_004032.
ESERTHHTV -> MMFSDSRAG (in isoform 2).

"Complete genome structure of the nitrogen-fixing symbiotic bacterium
                                                                                                                                                                                                                                                                                     Science 269:496-512(1995).
-!- CATALYTIC ACTIVITY: (3R)-3-hydroxyacyl-[acyl-carrier protein] +
NADP(+) = 3-0xoacyl-[acyl-carrier protein] + NADPH.
-!- PATHWAY: Fatty acid biosynthesis pathway; first reduction step.
-!- SIMILARITY: Belongs to the short-chain dehydrogenases/reductases (SDR) family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The function of the first one methyltransferase. Methylates Lys-9 of histone methylation represents a specific tag for epigenetic transcriptional represents a specific tag for epigenetic transcriptional represents.

13. H3 Lys-9 methylation represents a specific tag for epigenetic correctional represents.

14. CATALYTIC ACTIVITY: S-adenosyl-L-methionine + histone L-lysine = S-adenosyl-L-homocysteine + histone N(6)-methyl-L-lysine.

15. SUBCELLUIAR LOCATION: Nuclear; associates with centromeric constitutive heterochromatin (By similarity).

16. DOMAIN: Although the SET domain contains the active site of enzymatic activity, both pre-SET and post-SET domains are required for methyltransferase activity.

16. SIMILARITY: BELONGS TO THE HISTONE-LYSINE METHYLTRANSFERASE FAMILY.

17. SIMILARITY: Contains 1 A.T hook DNA-binding repeat.

18. SIMILARITY: Contains 1 pre-SET domain.

18. SIMILARITY: Contains 1 pre-SET domain.

18. SIMILARITY: Contains 1 SET domain.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Pred. No. is the number of results predicted by chance to have a
score greater than or equal to the score of the result being printed,
and is derived by analysis of the total score distribution.
                                                                                                                                                                            (without alignments)
